

ABSTRACT OF THE DISCLOSURE

A distributive web page management system for managing web page editing data of a website so that an editor can finish web page edition from any end user computer on the network. When a web page management system procedure is initiated, the user is registered in the system. The management system then downloads user assigned web page data to the end user computer according to predetermined privileges. The user edits web pages using the downloaded data and sends the edited web page data back to the server host. The management system replace the original data by the received web page data edited by the user according to his privilege so as to update the web page contents, thus completing the web page editing procedure.
